

# Setup Guide: Gap Crossing

Time Allocation: 60 Minutes

---

## Challenge Overview

The robot must safely traverse a 10cm wide gap or bridge layout without falling off the elevated track.

## Environment & Arena Setup

- **Arena Construction:** Create an elevated track using sturdy materials (such as foam board, wood, or heavy cardboard) elevated at least 5-10 cm off the table surface to simulate a true hazard.
- **The Gap:** Cut out a precise 10 cm wide gap or section in the middle of the track path. Ensure the edges of the gap are clean and stable so they do not sag under the robot's weight.
- **Safety Borders:** Place soft padding or low safety barriers underneath the gap area to protect robots from severe damage in the event of a fall.
- **Start/Finish Zones:** Mark a designated starting line at least 50 cm before the gap and a success zone 50 cm after the gap to allow for adequate run-up and stopping distance.
