

Setup Guide: Precision Parking

Time Allocation: 45 Minutes

Challenge Overview

The robot must navigate a marked course and park completely inside a designated 30cm x 30cm square zone.

Environment & Arena Setup

- **1. Clear the Floor Space:** Clear a flat, smooth indoor surface (such as a tile or low-pile carpeted floor) measuring at least 2 meters by 2 meters to serve as the testing arena.
- **2. Mark the Start Line:** Using colored painter's tape, place a clear 'Start' line on the floor to indicate where the robots must begin their run.
- **3. Define the Parking Zone:** Measure out an exact 30cm x 30cm square on the floor using contrasting colored tape (e.g., bright blue tape on a light floor). This square represents the designated parking space. Position it roughly 1.5 meters away from the start line, optionally adding a few simple turns or obstacles along the path to increase the challenge.
- **4. Safety and Testing Boundaries:** Set up perimeter boundaries (such as books or cardboard walls) if needed to keep stray robots from driving into furniture or off tables.
