

Setup Guide: Speed Run

Time Allocation: 60 Minutes

Challenge Overview

The robot must travel a straight 3-meter track and stop past the finish line in the shortest possible time.

Environment & Arena Setup

- **Track Creation:** Lay down a straight, flat path measuring at least 3.5 meters in length on a smooth, non-slippery indoor surface (such as low-pile carpet or clean gym flooring).
- **Start and Finish Lines:** Use high-contrast colored tape (e.g., black electrical tape on a light floor, or white tape on a dark floor) to clearly mark a **Start Line** at 0 meters.
- **The Finish Line:** Place a second piece of tape across the track at exactly **3.0 meters** from the start line. Ensure there is at least an extra 0.5 meters of clear runway *past* the finish line as a deceleration and stopping zone.
- **Safety Boundary:** Set up a soft barrier (like foam blocks or a folded mat) at the very end of the 3.5-meter runway to catch any robots that fail to stop in time.
- **Timing Equipment:** Provide instructors or student judges with reliable digital stopwatches or automated gate timers to record the elapsed time from the moment the robot crosses the start line until its front edge crosses the finish line.
